Seth Boss: AI Manifesto

Summary:

AI, like many recent technologies, has an enormous potential for good and evil, and needs to be used carefully and ethically. It should be used as a mentor, student, and teacher, but never as a plagiarism tool, as that will turn us into agents to be acted upon, rather than to act.

Applications:

1. Proofreading and finding bugs in code
2. Brainstorming
3. Explaining topics and providing valuable resources
4. Guidance in drafting papers, such as organization
5. Use as a search engine
6. Organizing and reformatting large amounts of data
7. Drafting useful prompts for other agents
8. Designing software for personal projects

Limitations and Boundaries:

1. No plagiarism or submitting AI-generated work as my own
2. No using AI without proper citation where appropriate
3. No leaning on AI as a crutch without learning and scrutinizing its output

Growth Plan:

1. Use AI as a catalyst for learning and research
2. Understand the foundation of how an AI works and thinks
3. Learn prompt engineering and how to leverage it for efficient workflows
4. Learn how to manage agents within an environment like VS Code or Antigravity
5. Research the best LLMs and which is best to use in each situation
6. Leverage AI in applications without spending large amounts of money
